How Influenza Can Spread Between People

Influenza is thought to be primarily spread through large droplets (droplet transmission) that directly contact the nose, mouth or eyes. These droplets are produced when infected people cough, sneeze or talk, sending the relatively large infectious droplets and very small sprays (aerosols) into the nearby air and into contact with other people. Large droplets can only travel a limited range; therefore, people should limit close contact (within 6 feet) with others when possible. To a lesser degree, human influenza is spread by touching objects contaminated with influenza viruses and then transferring the infected material from the hands to the nose, mouth or eyes. Influenza may also be spread by very small infectious particles (aerosols) traveling in the air. The contribution of each route of exposure to transmission is uncertain at this time and may vary based upon the characteristics of the influenza strain.

WHEN EMPLOYEES ARE MAKING ANY FACILITY VISIT (HOMES, OFFICES, COMMERCIAL) FOLLOW THE FOLLOWING RULES:

ONLY TALK TO THE CALLER BETWEEN GLASS DOOR OR GLASS WINDOW.

1. KEEP 5-6 FEET AWAY FROM CALLERS.
